DESCRIPTION

The sensors are used in hydraulic cylinders with a maximum pressure resistance of up to 400 bar. They are especially suited to be employed in harsh industrial environments where a high electromagnetic tolerance is required. The sensor works nearly unaffected by electrical or magnetical fields.

This sensor enables a connection of the hydraulic cylinders and machine controls.

Customised versions with different measurement ranges and flange types are available.

EXTERNAL ELECTRONICS IMCA

dimensions:

external electronics IMCA
(for DIN-rail mounting)

* Terminals 1 and 7 are internally connected.

Connection

The external electronics IMCA is designed to be installed in switch cabinets (Din-rail mounting). The connection to the sensor is conducted as connector with screw terminals.

CONNECTION

pin assignment

Pin A: primary 1
 Pin B: primary 2
 Pin C: secondary 1
 Pin D: secondary 2

mating connector: AT3106F 14S-6S
 (bitte extra bestellen)

At harsh EMC environments, it is possible to install the electronics at a max. distance of 100 m in a switch cabinet. A twin twisted pair cable (4-cores, minimum cross section 0,5 mm²), single or double shielded, is to be used for the further wiring to connect the external electronics to the system. It is recommended to ground the shield in the switch cabinet near the electronics (do not ground at the machine/ sensor). The sensor housing is grounded at the machine frame. To prevent interference, the cable length should not exceed 100 m.

ADJUSTMENT OF ZERO POINT AND GAIN

Please note that the zero point and gain may shift for long cable length between sensor and electronics. Thus install the sensor with the according cable length to the electronics and then adjust zero point and gain.

1. Push rod entirely in - adjust offset
 Move the sensor to the zero point of the measuring range and set the offset potentiometer on 0 mA / 0 V for the output signal.
2. Push rod entirely out - adjust gain
 Move the sensor to the end of the measuring range (push rod moved out) and set the gain potentiometer on 16 mA / 10 V / 5 V for the output signal.
3. Adjust offset (4...20 mA output only).
 Set the offset potentiometer on 20 mA (+4 mA) for the output signal.

Signal inversion:

If an inverted output signal is required (20...4 mA / 10...0 V / 5...0 V), swap clamps 6 and 8 (secondary coil) on the external electronics.
